

TEM VALIDATION

Maximizing Resources to Optimize Savings

Many companies are familiar with employee surveys designed to quantify a specific measurement in time. Most surveys hope for results. However, the best run organizations engage prescriptive and automated business tools based on data to ensure optimal process execution.

Introducing **Validation from MDSL**, an efficient and automated way to survey end users with technology inventory, allowing you to reduce spend and eliminate unused or oversubscribed services. Validation is a software module with multiple discrete components including:

- Zero Use Device/Service - Automated reports generated to capture active services associated with inactive users
- Self-Certification - Surveys sent directly to end users who self-report and validate whether services are needed, desired or no longer necessary, and to provide the business context of why
- Managed Certification - Triggered campaigns to managers and approvers to see if assigned inventory products are required (including context for why) and actually used, enabling managers to properly govern

Workflows are a related and recommended feature that automates the necessary processes acting on the insight of the responses. This improves automation and adherence. Some of these actions are cancellation, reassignment or procurement of services.

With Validation, you eliminate costs generated by unused services, remove manual processes, allow for process improvements extensible through multiple expense categories, improve product suitability between need and job assignment, and gain confidence in your contract negotiations with detailed reporting of needs and usages.
